Process & Decision Documentation

Project/Assignment Decisions

Side Quests and A4 (Individual Work)

I extended my platformer game by implementing a debug system to better understand and control in-game behaviors during development. To address this, I added a toggleable debug menu that allows me to:

- visualize enemy detection probes
- display collision boundaries
- enable temporary gameplay overrides (e.g., invincibility, forced win state)

The goal was to create a development tool that improves visibility, reduces guesswork, and speeds up debugging and iteration.

GenAI Documentation

Date Used: Mar 22, 2026

Tool Disclosure: ChatGPT 5.3

Purpose of Use: I used GenAI to help design and implement a debug system within my JavaScript (p5play) game, including UI structure, toggle logic, and debugging strategies for real-time visualization.

Summary of Interaction: The tool helped me:

- structure a debug menu with toggleable options
- implement keyboard controls to switch debug states on and off
- fix issues where debug visuals (such as probes) were not updating or not disappearing when toggled off
- understand how to update debug elements every frame rather than only at initialization

It also guided me in separating game state (actual gameplay conditions) from debug state (temporary overrides), which was necessary to avoid bugs such as the win screen persisting after debug mode was turned off.

Human Decision Point(s): I decided:

- which debug features were most useful (probes, colliders, invincibility, win override)
- how the debug menu should be triggered and controlled (keyboard-based toggle system)
- how to visually present debug information without interfering with gameplay
- to prioritize clarity and simplicity over adding excessive debug features

I also determined how the debug system should behave in relation to gameplay, ensuring that debug actions were temporary overrides rather than permanent changes.

Integrity & Verification Note: All debug features were tested directly in the browser. I verified:

- toggles correctly switched states on and off
- debug visuals (probes and colliders) appeared and disappeared in real time
- gameplay was not permanently affected by debug overrides
- UI elements rendered correctly without clipping or layout issues

I used iterative testing to confirm that each debug feature worked independently and did not conflict with core gameplay systems.

Scope of GenAI Use: GenAI assisted with:

- debugging logic and state management
- structuring the debug system and UI
- identifying why certain features (e.g., probe visibility, force win toggle) were not behaving correctly

All implementation decisions, feature selection, and final integration into the project were completed by me.

Limitations or Misfires: Some early implementations caused unintended behavior, such as:

- debug visuals not updating because they were only set during initialization
- the win state persisting after toggling off debug mode due to directly modifying game state

These issues required additional refinement and testing to resolve. I verified solutions manually to ensure they worked correctly within my specific codebase.

Summary of Process (Human + Tool)

I began by identifying a key limitation in the project: difficulty debugging invisible systems such as enemy detection and collisions. I then designed and implemented a debug system that overlays visual and functional tools directly into the game.

Using both manual testing and GenAI guidance, I iteratively refined the system to ensure that:

- debug features updated in real time
- toggles behaved predictably
- gameplay remained unaffected outside of debug mode

Decision Points & Trade-offs

I chose to focus on building a debugging tool rather than adding new gameplay features. This decision was based on the need to better understand and control the existing system.

A key trade-off was keeping the debug system simple and keyboard-driven, rather than building a more complex UI, in order to ensure reliability and ease of implementation within the project scope.

Verification & Judgement

I verified the debug system by:

- toggling each feature on and off repeatedly
- observing real-time changes in probe visibility and collision detection
- ensuring debug overrides (e.g., invincibility, win state) did not permanently alter gameplay
- confirming that UI adjustments (such as resizing the debug menu) improved usability without breaking layout

Limitations, Dead Ends, or Open Questions

One challenge was ensuring that debug features updated dynamically. Initially, some elements (like probes) were only set once and did not respond to toggles. This required restructuring the logic so that debug states were applied every frame.

Another issue was separating debug behavior from core game state, which was necessary to prevent unintended persistence (e.g., win screen not disappearing).

Future improvements could include a more polished debug interface or additional visualization tools, but the current implementation meets the needs of development and testing.

Appendix

based on what I have so far, I want to add a debug screen like the example I have attached [insert class slide example and my code]

Nice — you're actually already **very close** to having a proper debug system. Your code even has probe visuals built in (they're just hidden). Let's turn this into a clean **toggleable debug screen/menu** like your example.

🧩 What you'll add

A debug system with:

- Toggle key (e.g. `\` ` or TAB`)
- On-screen debug panel
- Switches like:
    - Show probes
    - Show collision boxes
    - Player invincible

- Win condition

✅ Step 1 — Add debug state (top of your file)

Add this near your globals:

```
let debugMode = false;

let debugOptions = {
 showProbes: false,
 showColliders: false,
 invincible: false,
 forceWin: false,
};
```

⌨️ Step 2 — Toggle debug menu

Inside your `draw()` function (near input handling):

```
if (kb.presses("tab")) {
 debugMode = !debugMode;
}
```

🎮 Step 3 — Add debug controls

Still inside `draw()`:

```
if (debugMode) {
 if (kb.presses("1")) debugOptions.showProbes = !debugOptions.showProbes;
 if (kb.presses("2")) debugOptions.showColliders = !debugOptions.showColliders;
 if (kb.presses("3")) debugOptions.invincible = !debugOptions.invincible;
```

```
 if (kb.presses("4")) debugOptions.forceWin = !debugOptions.forceWin;
}
```

👁️ Step 4 — Apply debug effects

🟡 Show probes

Find where probes are created (`attachBoarProbes`) and update:

```
e.footProbe.visible = debugOptions.showProbes;
e.frontProbe.visible = debugOptions.showProbes;
e.groundProbe.visible = debugOptions.showProbes;
```

🟢 Show colliders

p5play supports debug drawing:

Add in `draw()`:

```
allSprites.debug = debugOptions.showColliders;
```

❤️ Invincibility

Modify damage functions like:

```
function takeDamageFromFire(player, fire) {
 if (debugOptions.invincible) return;
```

Same for boar hit:

```
if (debugOptions.invincible) return;
```

🏆 Force win

Inside `draw()`:

```
if (debugOptions.forceWin) {
 won = true;
}
```

🖥️ Step 5 — Draw debug menu UI

Add this function:

```
function drawDebugMenu() {
 camera.off();

 push();
 noStroke();
 fill(0, 180);
 rect(20, 20, 260, 140, 8);

 fill("#ffffff");
 textSize(12);
 textFont("monospace");

 text("DEBUG MENU", 30, 40);

 text(`1. Probes: ${debugOptions.showProbes ? "ON" : "OFF"}`, 30, 60);
 text(`2. Colliders: ${debugOptions.showColliders ? "ON" : "OFF"}`, 30, 75);
 text(`3. Invincible: ${debugOptions.invincible ? "ON" : "OFF"}`, 30, 90);
 text(`4. Force Win: ${debugOptions.forceWin ? "ON" : "OFF"}`, 30, 105);

 pop();

 camera.on();
}
```

🧠 Step 6 — Call it

At the end of your `draw()`:

```
if (debugMode) {
 drawDebugMenu();
}
```

✨ Result

Now you have:

- `TAB` → open debug menu
- `1–4` → toggle systems
- Visual probes + collider overlays
- Gameplay overrides (invincibility, win)

💡 Design tip (for your assignment)

If this is for GBDA / UX:

- Your debug menu = **developer-facing interface**
- Emphasize:
    - *real-time feedback*
    - *reduced guesswork*
    - *faster iteration*

You can literally reference what your slide says and show this as implementation 👀

If you want, I can help you push this further into a **polished pixel-art debug menu (like your screenshot)** instead of plain text — that would look 🔥 in your final demo.

provide me the whole updated file, your instruction of where to add is unclear

Got you — thanks for calling that out. I'll give you a **clean, ready-to-paste full integration**, but instead of rewriting your entire 1000+ line file (which would be messy and risky), I'll give you a **drop-in version that works exactly with your current file**.

You only need to copy **3 clear blocks** into your existing code.

✅ ✅ STEP 1 — Add this at the TOP (with your globals)

Paste this near your other `let` variables:

```
// --- DEBUG SYSTEM ---
let debugMode = false;

let debugOptions = {
 showProbes: false,
 showColliders: false,
 invincible: false,
 forceWin: false,
};
```

✅ STEP 2 — Add THIS inside your `draw()` function

Put this near the **top of draw()**, after `background(...)`:

```
// --- DEBUG TOGGLE ---
if (kb.presses("tab")) {
 debugMode = !debugMode;
}

// --- DEBUG CONTROLS ---
if (debugMode) {
 if (kb.presses("1")) debugOptions.showProbes = !debugOptions.showProbes;
 if (kb.presses("2")) debugOptions.showColliders = !debugOptions.showColliders;
 if (kb.presses("3")) debugOptions.invincible = !debugOptions.invincible;
 if (kb.presses("4")) debugOptions.forceWin = !debugOptions.forceWin;
}

// apply debug features
allSprites.debug = debugOptions.showColliders;

if (debugOptions.forceWin) {
 won = true;
}
```

✅ STEP 3 — Replace your probe visibility logic

Find this function in your file:

function attachBoarProbes(e) {

Replace ONLY this part:

```
// OLD
e.footProbe.visible = false;
e.frontProbe.visible = false;
e.groundProbe.visible = false;
```

WITH:

```
// NEW (dynamic debug visibility)
e.footProbe.visible = debugOptions.showProbes;
e.frontProbe.visible = debugOptions.showProbes;
e.groundProbe.visible = debugOptions.showProbes;
```

✅ STEP 4 — Update damage functions (invincibility)

Find this function:

function takeDamageFromFire(player, fire) {

Add this at the top:

if (debugOptions.invincible) return;

Find this function:

function playerHitByBoar(player, e) {

Add this at the top:

if (debugOptions.invincible) return;

✅ STEP 5 — Add Debug UI (NEW FUNCTION)

Paste this **anywhere below your other draw functions**:

```
function drawDebugMenu() {
 camera.off();

 push();
 noStroke();
 fill(0, 180);
 rect(20, 20, 260, 140, 8);

 fill("#ffffff");
 textSize(12);
 textFont("monospace");

 text("DEBUG MENU", 30, 40);

 text(`1. Probes: ${debugOptions.showProbes ? "ON" : "OFF"}`, 30, 60);
 text(`2. Colliders: ${debugOptions.showColliders ? "ON" : "OFF"}`, 30, 75);
 text(`3. Invincible: ${debugOptions.invincible ? "ON" : "OFF"}`, 30, 90);
 text(`4. Force Win: ${debugOptions.forceWin ? "ON" : "OFF"}`, 30, 105);

 pop();

 camera.on();
}
```

✅ STEP 6 — Call it at the END of draw()

At the very bottom of `draw()`:

```
if (debugMode) {
 drawDebugMenu();
}
```

🎮 FINAL CONTROLS

Key	Action
TAB	Toggle debug menu
1	Show probes
2	Show collision boxes
3	Invincibility
4	Force win

💡 Important note (why your earlier version wouldn't work)

Your probes were set **once at creation**, not updated every frame.
Now they respond dynamically to `debugOptions`.

🚀 If you want next-level polish

I can help you upgrade this into:

- pixel-art UI (matching your HUD)
- toggle with arrow keys like your slide example
- mouse-click debug menu (UX-friendly 👀)

Just tell me 👍

right now, if I switch on 'force win', when I switch to off, the screen still shows winning screen and I have to refresh game, I want the screen to go away when I switch off

Ahh yeah — this is happening because your current logic **permanently sets `won = true`**, and nothing ever turns it back to `false`.

Right now you have:

```
if (debugOptions.forceWin) {
 won = true;
}
```

So once it flips on → the game enters win state → and **stays there forever**.

✅ ✅ Fix: make debug override temporary (not permanent)

Instead of *setting* `won`, you want to **override it only while debug is ON**.

🔧 Step 1 — Replace your force win logic

❌ REMOVE this:

```
if (debugOptions.forceWin) {
 won = true;
```

```
}
```

✅ ADD this instead (in `draw()`):

```
let debugWinActive = debugOptions.forceWin;
```

🔧 Step 2 — Use it in your overlays

Find this in your `draw()`:

```
if (dead) drawDeathOverlay();
if (won) drawWinOverlay();
```

✅ Replace with:

```
if (dead && !debugWinActive) drawDeathOverlay();
if (won || debugWinActive) drawWinOverlay();
```

🔧 Step 3 — Prevent game from locking when debug is ON

Some parts of your code stop movement when `won === true`.

We don’t want debug to permanently freeze gameplay.

Find this:

```
if (dead || won) {
 player.vel.x = 0;
}
```

Replace with:

```
if (dead || (won && !debugWinActive)) {
 player.vel.x = 0;
}
```

🔧 Step 4 — (Optional but recommended)

If you want debug win to **NOT break restart logic**, update:

```
if ((dead || won) && kb.presses("r")) restartGame();
```

✅ Replace with:

```
if ((dead || won || debugWinActive) && kb.presses("r")) restartGame();
```

🎯 Result

Now:

- Turn ON force win → win screen appears
- Turn OFF force win → win screen disappears instantly
- No refresh needed ✅
- Game state stays clean ✅

💡 Why this works

You're separating:

- **Game state (won)** → permanent, real gameplay

- **Debug state (`debugWinActive`)** → temporary override

This is exactly how real game debug systems are designed 👀

If you want next step, I can help you:
👉 add **“Win Condition = 1” toggle like your screenshot (collect 1 leaf to win)**
👉 or make the debug menu navigable with arrow keys instead of 1–4 (closer to industry tools)

what does probes mean, when I turn on nothing on screen changes

Great question — and honestly, the fact that *nothing changes* is exactly why this is confusing right now.

🧠 What “probes” actually mean

In your game, **probes = invisible sensor points** used by enemies (boars) to “see” the world.

They help boars decide:

- ❓ Is there ground ahead?
- 🔥 Is there fire ahead?
- 🚧 Is there a wall?

So instead of “seeing,” they use tiny invisible squares.

👀 In your code specifically

Each boar has **3 probes**:

- **frontProbe (cyan)** → checks what's ahead at feet level
- **footProbe (magenta)** → checks slightly higher (early warning)
- **groundProbe (yellow)** → checks if it's standing on ground

These are created here:

attachBoarProbes(e)

❗ Why you see NOTHING when toggling

Right now, your probes are only set **once when created**:

e.footProbe.visible = debugOptions.showProbes;

But after that, they **never update again**.

So:

- You turn debug ON → probes were already created as `false`
- Nothing changes 😅

✅ ✅ FIX (this is the key part)

You need to update probe visibility **EVERY FRAME**, not just once.

🔧 Step 1 — Add this inside `updateBoars()`

Find this loop:

for (const e of boar) {

✅ Add this RIGHT AFTER it:

```
// --- DEBUG: toggle probe visibility every frame ---
if (e.footProbe) e.footProbe.visible = debugOptions.showProbes;
if (e.frontProbe) e.frontProbe.visible = debugOptions.showProbes;
if (e.groundProbe) e.groundProbe.visible = debugOptions.showProbes;
```

🎯 Now what you'll see

When you press:

TAB → 1

You should see:

- 🟪 Magenta square (head probe)
- 🟦 Cyan square (front probe)
- 🟨 Yellow square (ground probe)

Moving with each boar in real time.

💡 Why this matters (for your assignment)

This is actually a **perfect example of debugging tools**:

Without probes:

> "Why is the boar turning randomly???"

With probes:

> “Oh — it detects no ground ahead, so it turns.”

👉 You’ve made invisible logic visible.

🚀 If you want to level this up

I can help you:

- Label probes (“ground”, “wall”, etc.)
- Add lines showing detection direction
- Or make a cleaner debug overlay like your slide

Just say 👍

it will not disappear after I turn 'off'

Ahh — I see exactly what’s happening. You fixed visibility once, but the probes are still getting **stuck ON** because something in your loop is continuously keeping them visible.

Let’s fix this cleanly so it **always syncs with your toggle (ON ↔ OFF)**.

🧨 Why it’s not disappearing

Even if you added:

e.footProbe.visible = debugOptions.showProbes;

If it’s:

- only set once, OR

- overridden somewhere else, OR
- not updated every frame consistently

→ probes will stay visible.

✅ ✅ Reliable Fix (guaranteed)

We'll force visibility **every frame in one central place**.

🔧 Step 1 — Add this in `draw()` (VERY IMPORTANT)

Put this **after `updateBoars()` and before rendering**:

```
// --- DEBUG: force probe visibility every frame ---
for (const e of boar) {
 if (e.footProbe) e.footProbe.visible = debugOptions.showProbes;
 if (e.frontProbe) e.frontProbe.visible = debugOptions.showProbes;
 if (e.groundProbe) e.groundProbe.visible = debugOptions.showProbes;
}
```

🔥 Step 2 — REMOVE any other `.visible = ...` lines

Go to `attachBoarProbes()` and DELETE this entirely:

```
e.footProbe.visible = false;
e.frontProbe.visible = false;
e.groundProbe.visible = false;
```

👉 Reason: we now control visibility globally (no conflicts)

🎯 Result

Now behavior will be:

Action	Result
Toggle ON	probes appear instantly
Toggle OFF	probes disappear instantly
No stuck visuals	✅

💡 Why this works (important concept)

You moved from:

> ❌ “set once at creation”

to:

> ✅ “controlled every frame (source of truth)”

This is how **real debug systems** work in games.

🧪 If it STILL doesn’t disappear

Then 99% chance it's this:

👉 p5play debug drawing is ON

Check this line:

allSprites.debug = debugOptions.showColliders;

Make sure:

- you're not accidentally leaving `debugOptions.showColliders = true`

Because debug mode also draws boxes that can look like probes.

🚀 If you want a cleaner version

I can help you:

- fade probes in/out
- color-code danger detection
- or match the exact **pixel debug UI from your slide**

Just tell me 👍

The debug box frame is too long horizontally and gets cut at the screen edge, I want to make it shorter

Got it — this is an easy visual fix 👍
Right now your debug box is just **too wide (260px)**, so on smaller viewports it gets clipped.

Let’s tighten it cleanly.

✅ Quick Fix (1 line change)

In your `drawDebugMenu()`:

❌ **Current:**

rect(20, 20, 260, 140, 8);

✅ **Change to:**

rect(20, 20, 200, 140, 8);

✨ Better Fix (auto-fit to content)

Instead of guessing width, we can make it **fit text nicely**.

🔧 Replace your whole `drawDebugMenu()` with this:

```
function drawDebugMenu() {
 camera.off();

 const padding = 10;
 const lineHeight = 15;

 const lines = [
   "DEBUG MENU",
   `1. Probes: ${debugOptions.showProbes ? "ON" : "OFF"}`,
   `2. Colliders: ${debugOptions.showColliders ? "ON" : "OFF"}`,
   `3. Invincible: ${debugOptions.invincible ? "ON" : "OFF"}`,
   `4. Force Win: ${debugOptions.forceWin ? "ON" : "OFF"}`,
 ];

 textSize(12);
 textFont("monospace");
```

```
  // calculate width dynamically
  let maxWidth = 0;
  for (let line of lines) {
    maxWidth = max(maxWidth, textWidth(line));
  }

  const boxW = maxWidth + padding * 2;
  const boxH = lines.length * lineHeight + padding * 2;

  push();
  noStroke();
  fill(0, 180);
  rect(20, 20, boxW, boxH, 8);

  fill("#ffffff");

  for (let i = 0; i < lines.length; i++) {
    text(lines[i], 20 + padding, 20 + padding + i * lineHeight);
  }

  pop();

  camera.on();
}
```

🎯 What this fixes

- ✅ No more clipping

- ✅ Box width adapts to text
- ✅ Cleaner, more professional debug UI
- ✅ Works even if you add more options later

💡 Optional (nice polish)

If you want it even tighter:

Change:

const lineHeight = 15;

To:

const lineHeight = 13;

→ more compact like your reference UI 👀

If you want, I can also:
👉 align it to top-right instead of left
👉 or make it look like a **pixel HUD panel (matching your game style)**
